

# ASTRONOMY 2020

## Supplementary Information

### CANBERRA

Quasar Publishing  
Version 1.0

This year for our thirtieth edition we have made some changes. As part of this we have removed some data from the yearbook.

To decide what could be taken out we reviewed how the people, who value our book, participate in the hobby and how has this evolved over the years. For the true beginners with little more than a sense of wonder and a thirst to know, we believe they are well catered for in Astronomy 2020.

Telescope users have become polarised into two camps. There are those we call the pure observers who, with some knowledge, spend their money on the optics, taking a more low cost approach to their mounts. Then there are the people who ride the back of the technology revolution turning to computer controlled scopes, now much more affordable instruments, that can automatically slew to an object selected from its database.

Keeping this in mind, we had a hard look at the sea of numbers in Part II. Printed rise and set times for all the planets are not used by the beginner or pure observer and not needed by the techies. Besides, no one observes the planets (or anything) close to the horizon unless they have to. For this reason we

believe the approximate times given in the Rise–Set charts in Part I should suffice. Often the transit times for the outer planets are more valuable, when the planet is high in the northern sky with minimal atmospheric turbulence. Using the same reasoning, the position tables of the Sun, Moon and planets are either not used or not necessary.

When we started these books in 1990 there was no internet (believe it or not!), so some of the information we supplied wasn't easily obtainable elsewhere. Today a lot is available either online, from computer programmes or through cheap (or free) astronomy/planetarium apps on mobile devices. The lunar occultation tables are no longer included as the Occult software (written by Australian David Herald) is readily available for download and it can tailor event times for your location. Nevertheless, if you still need this information it is now available here.

The data on the following pages (available for download from our web site) is supplementary to the yearbook ASTRONOMY 2020 that we published in October 2019. Note there is a separate PDF for each capital city in Australia.

[www.quasarastronomy.com.au/downloads---2020.html](http://www.quasarastronomy.com.au/downloads---2020.html)

In the event you are reading this and don't know what the yearbook we are referring to is, have a look here.

# LUNAR OCCULTATIONS for CANBERRA (35° 15' S, 149° 08' E)

**INTRODUCTION** From month to month the Moon does not occult the same stars. In fact over a number of years it drifts in declination between plus and minus 28°. The brighter stars that the Moon occults are listed in the Zodiacal Catalogue (ZC). There are about 3500 stars in the ZC.

The Moon moves from west to east, so it rises and sets later each day. From just after New Moon to just before Full Moon, stars being occulted disappear behind part of the dark limb and reappear from the bright limb. The limb is another term for the edge of the Moon. After Full Moon a star disappears on the bright limb and reappears on the dark limb. There is no dark limb at Full Moon.

Dark limb events, in particular disappearances, are the easiest to observe. Following a star until it *winks out* is much easier than scanning the lunar limb, waiting for it to suddenly reappear. The brighter the star, the more spectacular the event. The table here present the easier to observe occultations for this year as predicted. Both events, the disappearance and reappearance, are not necessarily included. An event may not be present because:

1. The Moon is in daylight.
2. The Moon is too close to or below the horizon.
3. For faint stars, events on a bright limb (in particular reappearances) are difficult to observe and have been omitted.

**TELESCOPE REQUIREMENTS.** These vary greatly with the brightness of the star being observed, the brightness of the Moon (how close to Full Moon) and whether the event is on a bright or dark limb. Disappearances of first magnitude stars on the dark limb can be observed with the naked eye.

[www.lunar-occultations.com/iota/iotandx.htm](http://www.lunar-occultations.com/iota/iotandx.htm)  
[www.occultations.org.nz](http://www.occultations.org.nz)

The faintest stars, which have occultation predictions, are about 6.5 magnitude. The criteria for selection are complex involving the Sun and Moon altitude, star magnitude and whether it is a bright or dark limb event.

**EST** the date and time of the occultation, hr and min are in EST  
**OBJECT** n, nn, nnn, nnnn ZC catalogue number  
 ggg ccc Greek letter and constellation abbreviation  
 n ccc Flamsteed number and constellation  
 name of planet, satellite or deep sky object.

**PD** event, consisting of two letters.  
 The first letter is the Event type: D = Disappearance and R = Reappearance. The 2<sup>nd</sup> letter represents: D = Dark limb, B = a bright limb event. G indicates a graze at or near the location. M means a miss with a graze nearby.

**Mag** magnitude of the star.  
**Elg** elongation or separation of the Moon from the Sun as measured in degrees.

**Alt** altitude of the Moon during the occultation.  
**PA** position angle is the position the event occurs on the limb of the Moon (measured as degrees east of north).

**A** coefficient of longitude (see below)  
**B** coefficient of latitude (see below)  
 NB. For some stars, close to grazing, A and B values would be useless, and no values are shown.

## CALCULATING EVENT TIME FOR OTHER LOCATIONS

Unless the event is close to a graze (PA is close to 0° or 180°) this method will give a good approximation for any location within about 500 km of this city. The predicted time at your location is given by:

$$\text{Predicted Time} = \text{Time from Table} + (A \times n) + (B \times p)$$

where *A* and *B* are taken from the table below and *n* and *p* are given by (convert to decimal degrees)

$$n = \text{your longitude} - \text{reference longitude}$$

$$p = \text{reference latitude} - \text{your latitude}$$

you need to preserve the signs of *n* and *p*, that is, whether they are positive or negative and it is best to use your closest city.
